Trimble® Business Center – Version 5.41

Because Trimble takes cyber security measures seriously for all of our users past and present, TBC v5.41 includes the following security updates, which are required to support various features as described:

- **Trimble Identity (TID)** – Security for ID profiles has been enhanced to provide safe, continued support for products within Trimble that require a TID (for example, Clarity).
- **Data streaming** - Security for data streaming from TBC to Clarity and for exporting KML with panoramas has been enhanced to provide safe, continued support for these features.
- **Trimble web services** – Security for Trimble web services has been enhanced to provide safe, continued support for this feature.

TBC v5.41 also includes the following resolved issues:

- A user could not acquire a subscription license with a non-Unicode username (for example, a name using Japanese characters).
- An error could occur when a user tried to obtain a subscription license for TBC on a computer on which another user had previously obtained a subscription license for TBC.
