WorksOS

New & Improved

This WorksOS release includes these new features and enhancements:

Import/Export

- **Import drone imagery** - You can now import GeoTIFF files (.tiff format with raster orthoimagery from Trimble Stratus or other 3rd party software) into WorksOS. After import, you can use a GeoTIFF as the background image for your project over the map. As your project progresses, you can import additional GeoTIFFs of the same area that show the different phases of work being completed. The most recent image is the default top image. When you change the date of your view, the corresponding drone image will appear.

For details, see the help thread/document called Imports, Exports, & Reports in the [WorksOS Resource Center](#). See the demo video [here](#).

Map

- Map improvements for faster tile rendering when turning on and off toggles in the Map Settings slider.

Other

- Search function added for fast selecting a Design in the dropdown in Work Remaining and Work Completed Volume Calculations.
- Japanese Characters (type from a Japanese Keyboard) now supported in WorksOS.

Fixed

WorksOS also deployed fixes for reported or discovered cases in which:

- There are no other fixes to report at this time.

Other

Known issues

- Back end performance improvements to dashboard loading and tile rendering is currently in development.
